AIR FORCE CIVIL ENGINEER SUPPORT AGENCY

Record of Changes (changes are indicated by \1\.../1/)

| Change No. | Date: | Location |
|------------|-------------|---|
| 1 | 28 Jul 2011 | Modified throughout to address comments received and to coordinate with other updated criteria and standards. |
| 2 | 01 Jul 2012 | Incorporated UFC 3-575-01. As part of this change, extensively modified grounding criteria by incorporating IEEE C2 and updated other sections. |

FOREWORD

The Unified Facilities Criteria (UFC) system is prescribed by MIL-STD 3007 and provides planning, design, construction, sustainment, restoration, and modernization criteria, and applies to the Military Departments, the Defense Agencies, and the DoD Field Activities in accordance with USD(AT&L) Memorandum dated 29 May 2002. UFC will be used for all DoD projects and work for other customers where appropriate. All construction outside of the United States is also governed by Status of forces Agreements (SOFA), Host Nation Funded Construction Agreements (HNFA), and in some instances, Bilateral Infrastructure Agreements (BIA.) Therefore, the acquisition team must ensure compliance with the more stringent of the UFC, the SOFA, the HNFA, and the BIA, as applicable.

UFC are living documents and will be periodically reviewed, updated, and made available to users as part of the Services' responsibility for providing technical criteria for military construction. Headquarters, U.S. Army Corps of Engineers (HQUSACE), Naval Facilities Engineering Command (NAVFAC), and Air Force Civil Engineer Support Agency (AFCESA) are responsible for administration of the UFC system. Defense agencies should contact the preparing service for document interpretation and improvements. Technical content of UFC is the responsibility of the cognizant DoD working group. Recommended changes with supporting rationale should be sent to the respective service proponent office by the following electronic form: Criteria Change Request (CCR). The form is also accessible from the Internet sites listed below.

UFC are effective upon issuance and are distributed only in electronic media from the following source:

Whole Building Design Guide web site http://www.wbdg.org/.

Hard copies of UFC printed from electronic media should be checked against the current electronic version prior to use to ensure that they are current.

UNIFIED FACILITIES CRITERIA (UFC) NEW DOCUMENT SUMMARY SHEET

Document: UFC 3-501-01, Electrical Engineering, with Change 1, 28 July 2011

Superseding:

- UFC 3-501-01, Electrical Engineering
- Draft UFC 3-500-10, Electrical Engineering has been renumbered to this document. Draft UFC 3-500-10 superseded Draft UFC 3-500-10N, Electrical Engineering. These documents were made mandatory \1\ requirements /1/ by the Navy and published on the Navy Design-Build Master (NDBM) website at http://www.wbdg.org/ndbm/design_guidance.php.
- UFC 3-501-03N, *Electrical Engineering Preliminary Considerations*.

Description: This UFC 3-501-01 provides electrical engineering design and analysis criteria for design-build and design-bid-build projects. It is organized to provide the top-level \1\ minimum mandatory electrical requirements /1/ and refers to other UFCs as appropriate.

Reasons for Document:

- Provides technical requirements for \1V1/ electrical system design criteria.
- Establishes design analysis requirements in support of design activities.
- Defines minimum requirements for design drawings in terms of drawing types and content.
- Provides links to related material in other UFCs.

Impact: There are negligible cost impacts associated with this UFC. However, the following benefits should be realized.

- Standardized guidance has been prepared to assist electrical engineers in the development of the plans, specifications, calculations, and Design/Build Request for Proposals (RFP).
- This UFC coordinates with all electrical-related UFCs and provides \1\ requirements consistent /1/ with the other electrical-related UFCs.

CHAPTER 1 INTRODUCTION

1-1 PURPOSE AND SCOPE.

The purpose of this UFC is to provide technical \1\ requirements /1/ for general aspects of the electrical design of projects. The information provided in this \1\ UFC shall /1/ be used in the development of the plans, specifications, calculations, and Design/Build Request for Proposals (RFP) and \1\ shall /1/ serve as the minimum electrical design requirements for design-build and design-bid-build projects. Project conditions may dictate the need for a design that exceeds these minimum requirements.

This UFC provides the top-tier baseline \1\ requirements /1/ for electrical UFCs and is intended as a reference for all electrical work on projects. Figure 1-1 shows the relationship of this UFC to other related UFCs. They rely on this UFC for overall \1\ requirements /1/ regarding design analysis and documentation. There are existing individual service UFCs and other UFCs under development; these documents are identified in similar figures in Appendix B.

Modernization of electrical systems solely for the purpose of meeting design criteria in UFCs is not required. Upgrades or modifications to electrical systems should consider the design criteria in this UFC, but it is not intended that an entire facility or system require modernization solely because of a minor modification.

1-2 APPLICABILITY.

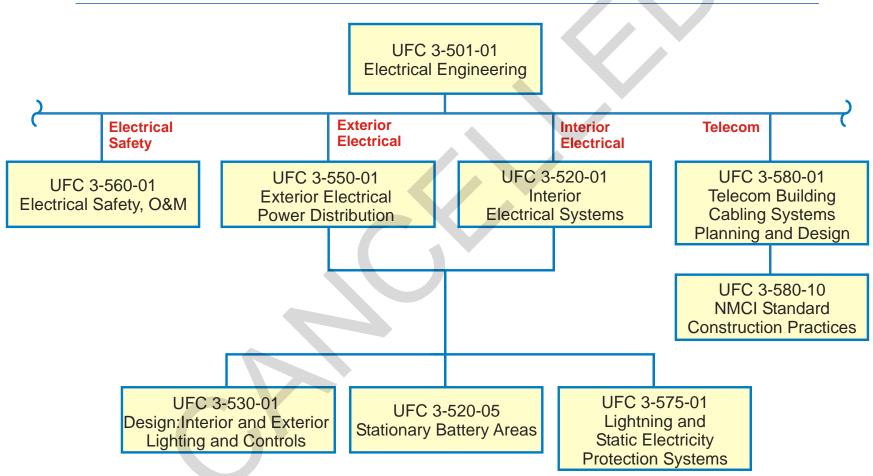

Compliance with this UFC is mandatory for the design of electrical systems at all facilities, bases, and at leased facilities. Leased facilities are defined in UFC 4-010-01.

Facilities located outside of the United States must also comply with the applicable host nation standards; refer to UFC 3-510-01 for additional information. Different voltages, frequencies, and grounding conventions often apply in other host nations; however, follow the design principles provided in this UFC to the extent practical. U.S. Department of Commerce International Trade Administration document, *Electric Current Abroad*, provides additional information and can be obtained at http://www.ita.doc.gov/media/publications/pdf/current2002final.pdf.

1-3 GENERAL BUILDING REQUIREMENTS.

UFC 1-200-01, "General Building Requirements", provides applicability of model building codes and government-unique criteria for typical design disciplines and building systems, as well as for accessibility, antiterrorism, security, sustainability, and safety. Use this UFC in addition to UFC 1-200-01 and the UFCs and government criteria referenced therein.

Figure 1-1 Electrical UFC Delineation

Refer to Appendix B for additional UFC delineation.

1-4 CRITERIA AND EXEMPTION WAIVER PROCESS.

The criteria and exemption waiver process is provided in MIL-STD 3007. /2/

1-5 REFERENCES.

Appendix A contains the list of references used in this document.

1-6 DESIGN STANDARDS.

\1\/1/ The electrical Designer of Record \1\ shall /1/ satisfy each of the following for each project:

\1\

- a. Apply NFPA 70 and IEEE C2 to electrical designs...
- b. Provide contract documents that fully indicate the scope of work.

/1/

- c. Comply with \1\/1/ applicable UFCs, codes, regulations, laws, and service-specific requirements.
- d. Provide a completed project within funding limits.
- e. Provide a completed project within scope of work limits.
- f. Provide a completed project of acceptable appearance within design standards.
- g. Provide a completed project with coordinated systems (structural, mechanical, electrical, and other applicable disciplines).
- h. Provide complete, accurate, and coordinated construction documentation for the project.
- i. Provide a completed project considerate of the ecological, physical, and visual features of the site.
- j. \1\ Comply /1/ with applicable environmental requirements.
- k. Provide a completed project that incorporates sustainable design principles.
- I. Provide a completed project, meeting the \1\ Installation Appearance Plan (IAP) or Base Exterior Architectural Plan (BEAP), as applicable. /1/

\2\/2/

1-7 PERMITS – CONSTRUCTION, ENVIRONMENTAL, AND OTHER.

Identify the permits and fees necessary for environmental, construction, and operation of facilities.

CHAPTER 2 DESIGN REQUIREMENTS

2-1 \1\ GENERAL /1/.

Design electrical systems to meet the needs of the activity and supporting facilities in accordance with this document.

\1\/1/ Electrical equipment \1\ shall /1/ be manufacturer's standard catalog products and \1\ shall /1/ conform to the latest published industry and technical society standards at the date of contract award. Underwriters Laboratories (UL) \1\ listing /1/ or third-party certification is required for all basic equipment. Use of shop or field fabricated electrical equipment assemblies that are not manufacturer's standard catalog products or do not conform to the industry and technical society standards are not acceptable.

2-1.1 HAZARDOUS MATERIALS AND WASTE.

Demolition or replacement of existing electrical equipment may involve hazardous materials and waste. This equipment includes, but is not necessarily limited to the following:

- Pad mounted transformers dielectric fluid containing PCBs, lead paint on the exterior
- Pad mounted switches dielectric fluid containing PCBs, lead paint on the exterior
- Oil-fused cutout switches dielectric fluid containing PCBs
- Capacitors dielectric fluid containing PCBs
- Pole mounted transformers dielectric fluid containing PCBs
- Fluorescent ballasts dielectric fluid containing PCBs
- Fluorescent and HID lamps mercury
- Self-luminous exit signs tritium
- Lead cables lead
- Manholes and handholes asbestos fireproofing
- Storage batteries lead, cadmium, lithium, and electrolytes

2-1.2 REMOVAL OF EXISTING CABLES AND CONDUCTORS.

When a project requires removal of existing cables and conductors enclosed in either duct or conduit, they \1\ shall /1/ be physically removed. Associated ducts or conduits may be abandoned in place only for the following conditions:

• They are planned for re-use.

- Removal will cause substantial facility damage.
- Conduits are inaccessible.

On duct systems between underground structures (handholes, manholes, and vaults), \1\ provide /1/ a pull wire (string or rope) for future use, and seal both ends of duct.

2-1.3 MODIFICATION TO EXISTING ELECTRICAL EQUIPMENT.

Existing equipment to be "Modified" or "Added to" \1\ shall /1/ be uniquely identified. This identification shall include the manufacturer's name and other pertinent manufacturer's identification (e.g., serial number, model number, style), if such information exists.

2-1.4 SALVAGED MATERIALS AND EQUIPMENT.

Demolition projects may require equipment or material to be salvaged for, or by the Government. Uniquely identify all salvageable equipment or material. This identification shall include the manufacturer's name and other pertinent manufacturer's identification including serial number, model number, style, physical dimensions, and weight if such information exists. Indicate who is responsible for removal, storage, and transportation.

2-1.5 SCHEDULING AND SEQUENCING OUTAGES.

Designer of Record shall:

- Determine and identify scheduling, sequencing, and outage requirements including anticipated outage durations as a part of contract design documents.
 Include a specific and detailed suggested sequence of construction and identify any temporary requirements.
- Require the contractor to review all identified requirements and submit outage requests for approval by the Government prior to initiating the specific work task.
- Require that all work complies with the electrical safety requirements contained in UFC 3-560-01 \1\ for government workers and EM-385-1-1 for contractor work/1/.

\1\ Note: UFC 3-560-01 is usually more stringent than EM 385-1-1. However, it may be invoked on contractor work when desired and agreed to by the Activity. In that case, modify contract documents appropriately/1/.

2-1.6 CALCULATIONS.

\1\ Provide /1/ calculations as specified in Chapter 3.

2-1.7 ENERGY EFFICIENCY AND SUSTAINABLE DESIGN.

Comply with UFC 3-400-01 to meet the energy conservation mandates of ASHRAE 90.1; EPACT 2005; Executive Order 13423; and the Energy Independence and Security Act of 2007.

Provide sustainable design, energy efficiency, and green procurement of environmentally preferable materials to achieve the required LEED or other agency certification level in accordance with UFC 4-030-01.

2-1.8 ANTITERRORISM AND PHYSICAL SECURITY.

UFC 4-010-01 is a multidiscipline document which contains several standards that may impact electrical system design. Electrical designers \1\ shall /1/ be familiar with UFC 4-010-01 and how it may affect the design of utilities, service entrance equipment, emergency backup systems, and bracing of electrical equipment. Incorporate the minimum standards into the design of all new construction and major renovations of inhabited DoD buildings.

UFC 4-020-01 supports the planning of DoD facilities that include requirements for security and antiterrorism. Use in conjunction with UFC 4-010-01 to establish the security and antiterrorism design criteria that will be the basis for DoD facility designs.

2-1.9 \1\ CORROSIVE AND HIGH HUMIDITY AREAS. /1/

The special design \1\ requirements /1/ listed below apply when electrical equipment is routinely subjected to salt spray \1\ (such as installations at piers and wharves) /1/ or is installed in locations exposed to condensing humidity that has historically caused premature rusting and degradation of equipment enclosures.

- \1\ Entire transformer assembly shall /1/ be corrosion resistant and be fabricated of stainless steel.
- Use stainless steel cabinets and hardware for pad-mounted switchgear, \1\
 switchboards, /1/ and sectionalizing termination cabinets.
- Use stainless steel enclosures and hardware for exterior safety switches and other electrical equipment.
- Do not use aluminum-conductor steel-reinforced (ACSR) overhead conductors.

\1\/1/

 When feasible, equipment enclosures can be designed to comply with NEMA 4X non-metallic enclosure requirements instead of stainless steel if the enclosures are not subject to physical or structural integrity damage.

2-1.10 ARC FLASH WARNING LABELS.

Provide arc flash warning labels on \1\ electrical equipment likely to require examination, servicing, or maintenance while energized. Some typical types of equipment include pad-mounted transformers, /1/ switchgear, switchboards, panelboards, disconnect switches, industrial control panels, meter socket enclosures, and motor control centers that are in other than dwelling occupancies. \1\ Provide labels in accordance with the format shown in Figure 2-1. AutoCAD format and Adobe PDF format files are available at

http://www.wbdg.org/ccb/NAVGRAPH/arc_flash_warning_labels.zip. /1/

Figure 2-1 Typical Arc Flash Warning Label

\2\

2-1.11 NFPA 70 (NEC) / IEEE C2 (NESC) DESIGN INTERFACE POINTS.

Design buildings and similar support structures such as piers, wharfs, parking structures, sewage pump stations, and fueling facilities in accordance with the general requirements of NFPA 70:

- The demarcation for the "service point" (for clarification of the NFPA 70 Article 100 definition) shall be at the building/similar support structure service equipment line side connection.
- The demarcation between NFPA 70 and IEEE C2 for electrical power design purposes shall be the secondary terminal of the building/support structure utilization electric supply system.
- The demarcation between NFPA 70 and IEEE C2 for communication and security systems shall be the incoming service interface equipment including the five foot raceway extension outside the building/support structure.

Figure 2-2 illustrates the above.

Design all exterior underground and overhead, medium and low voltage systems not specifically associated with a building/support structure in accordance with the general requirements of IEEE C2 except that NFPA 70 ampacity and conduit fill tables shall be utilized to the extent possible for all designs.

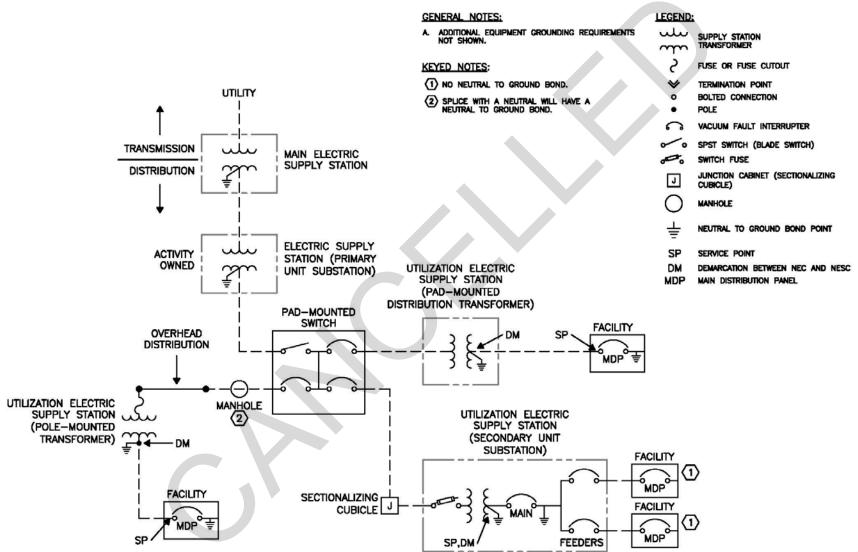

Design the following in accordance with the general requirements of NFPA 70:

- Exterior lighting systems (parking lot, roadway, security, and sports).
- Exterior branch or feeder circuits originating from building/support structure service equipment.
- Wiring from and connections to non-utility equipment supplying power to the wiring system of the facility or the low-voltage terminals of the medium-voltage distribution system, including engine-generator sets, photovoltaic power systems, wind turbines, and fuel cells.

Figure 2-2 Illustration of NFPA 70 and IEEE C2 Demarcation

UFC 3-501-01 February 3, 2010 Replaces 3-500-10 (DRAFT) and 3-500-10N (DRAFT) Including Change 2, July 1, 2012

2-2 SITE EXTERIOR POWER DISTRIBUTION SYSTEMS.

The site utility distribution system \1\ shall /1/ be compatible with the existing system and comply with UFC 3-550-01. Where the site service is derived from an existing primary feeder, the designer \1\ of record shall coordinate with the government authority and shall receive direction regarding point of connection and concurrence that /1/ existing circuit can support the new loads.

2-2.1 EXTERIOR POWER DISTRIBUTION SYSTEMS, INCLUDING HOUSING AREAS.

Comply with UFC 3-550-01.

2-2.2 DOCKSIDE UTILITIES FOR SHIP SERVICE.

Comply with UFC 4-150-02.

2-2.3 EXTERIOR LIGHTING SYSTEMS.

Comply with UFC 3-530-01.

2-2.4 AIRFIELD LIGHTING.

Comply with UFC 3-535-01.

2-2.5 CATHODIC PROTECTION SYSTEMS.

Comply with UFC 3-570-02N for the Navy and UFC 3-570-02A for the Army.

2-3 INTERIOR DISTRIBUTION SYSTEMS.

2-3.1 INTERIOR ELECTRICAL SYSTEMS.

Comply with UFC 3-520-01.

2-3.2 INTERIOR LIGHTING SYSTEMS.

Comply with UFC 3-530-01.

2-3.3 \1\ EMERGENCY AND STANDBY SYSTEMS. /1/

- **2-3.3.1 Exit and Emergency Lighting.** Comply with UFC 3-530-01.
- **2-3.3.2 Fire Alarm Systems.** Comply with UFC 3-600-01.
- **2-3.3.3 Generators.** Comply with UFC 3-520-01.

2-3.4 SENSITIVE COMPARTMENTED INFORMATION (SCIF) FACILITIES.

\1\ Comply with ICD 705, ICS 705-1, ICS 705-2, and with IC Tech Spec for ICD/ICS 705./1/

2-3.5 HAZARDOUS LOCATIONS.

Show boundaries of hazardous locations on the plans and identify the type of hazard by class, division, and group.

2-3.6 BATTERY AREAS AND BATTERY RACKS.

Comply with UFC 3-520-05.

- 2-4 COMMUNICATIONS AND SECURITY.
- 2-4.1 TELECOMMUNICATION SYSTEMS.
- **2-4.1.1 General.** Overhead and underground communications systems \1\ shall /1/ comply with UFC 3-580-01 and, additionally for the Navy, UFC 3-580-10. However, the requirements of this paragraph take precedence if conflicts with UFC 3-580-01 and 3-580-10 exist. Coordinate requirements with the Base Communications Officer (BCO). For the Navy, coordinate NMCI data service with the Base NMCI Representative. \2\ Provide Category 6 Unshielded Twisted Pair (UTP) copper cable for horizontal voice and data cables. /2/
- **2-4.1.2 Outside Plant.** \1\ Provide /1/ underground telecommunications wiring in conduit to a depth of 24 in (610 mm). Specify concrete encased conduits for telecommunications systems when associated power conduits are also concrete encased.

Unless directed otherwise by the BCO, size outside category 3 copper cable for a minimum of one pair per 100 ft² (9 m²) of building and provide a minimum of one 12 strand single-mode fiber optic cable for each facility. Coordinate cable selection and point of connection with the BCO and specify using RUS specifications.

Provide solid-state type primary communication circuit protectors with sneak current protection for all twisted pair media terminating inside a building from an overhead or underground outside plant.

2-4.1.3 BEQ/BOQ Housing. Completely wire the building interior conforming to UFC 4-721-10 and applicable \1\ TIA/EIA /1/ standards. In BEQ/BOQ housing, the communication room may be located every three floors provided cabling distances are within \1\ TIA/EIA /1/ standards.

For the Air Force, refer to ETL 02-12.

2-4.1.4 Family Housing. Provide a complete structured telecommunications system in accordance with \1\ TIA/EIA-570B /1/. Provide Grade 1 wiring for units with less than 1500 ft² (140 m²) and Grade 2 wiring (excluding optical fiber) for units with 1500 ft² (140 m²) or more. Locate the distribution device adjacent to the residential load center. In addition to outlet locations required by \1\ TIA/EIA-570B /1/, provide two outlets on opposite walls in the living room, family/great room, den/study, and each bedroom. Provide one outlet in dining room and garage.

2-4.2 TELEVISION SYSTEMS.

Coordinate television system requirements with the activity.

2-4.3 COMMUNITY ANTENNA TELEVISION (CATV) SYSTEMS.

\1\ Comply with /1/ UFC 3-580-01. Coordinate exterior cable installation with the local service provider and Base Communications Officer (BCO). Provide a conduit and pull wire from a point of connection to the base system and the main distribution equipment.

2-4.4 ELECTRONIC SECURITY SYSTEMS (ESS).

\1\ Comply with UFC 4-021-02NF for Navy and Air Force. Comply with /1/ UFC 4-020-04A for the Army.

2-4.5 MASS NOTIFICATION SYSTEMS.

Comply with UFC 4-021-01.

CHAPTER 3 DESIGN ANALYSIS AND DOCUMENTATION

3-1 GENERAL.

This chapter defines the minimum information that \1\ shall /1\ be provided at the various design submittal levels. During the design submittal process, the Designer of Record \1\ shall clarify /1\ comments with the appropriate Government reviewer rather than wait until the next submittal to respond. Whenever possible, the Designer of Record is encouraged to meet with the reviewer to discuss comments.

3-2 DESIGN ANALYSIS.

The Design Analysis is a presentation of facts to demonstrate the concept of the project is fully understood and the design is based on sound engineering principles. As a minimum, include the following information in the Design Analysis.

3-2.1 BASIS OF DESIGN.

Document design decisions throughout the design process. List any special features and alternatives that were considered. Provide a written narrative accurately addressing the electrical and telecommunication design. Describe the design approach to all electrical systems. Include the method used for sizing conductors, conduit, protective devices, and other equipment. Show all calculations used in determining capacities of electrical systems. When tables from industry standards are used in the design, indicate the title, source, and date of the document. Include a complete list of all design standards and references used for the design.

Update the Basis of Design for each submittal to accurately show the current state of the design. Include the information in the following sub-paragraphs as a minimum.

3-2.1.1 \1\ Exterior Primary Power Distribution Systems. /1/

\1\

- Existing Primary Power Source Identify the location of the point of connection into the existing primary system. Address the characteristics of this primary system, including ANSI voltage designation, phase, number of conductors, available fault current, and the circuit grounding classifications (ungrounded, uni-grounded, resistance grounded, or multi-grounded). Address the adequacy of the primary system; if inadequate, state measures proposed to correct the inadequacy.
- Estimated Electrical Project Load Provide an estimate of total connected load (kVA) and the resulting demand load (kVA), transformer size, and service size.

- Voltage Selection Provide basis for selection of primary and secondary voltages.
- Conductors Include conductor size, type, number of conductors, insulation voltage rating, and insulation level.
- Standards of Design Describe pertinent standards of design, such as voltage drop, and equipment ratings.
- Materials Provide manufacturer's data sheets and product data for selected equipment.

3-2.1.2 Other Exterior Systems.

- Telecommunications (including voice, video and data) System Identify point
 of connection into base system. Describe modifications, if required, to
 existing base system.
- Special Systems Identify any special systems, such as Electronic Security Systems (ESS) or Cable Television (CATV). Describe how and where the facility will connect to the basewide Mass Notification System.
- Exterior Lighting Systems Describe types of luminaires and illuminance values.
- Alternate Energy Sources Describe alternate energy systems such as engine-generator sets, photovoltaic power systems, wind turbines, and fuel cells.
- Conductors Include conductor type and number of conductors.
- Standards of Design Describe pertinent standards of design, such as voltage drop and equipment ratings.
- Materials Provide manufacturer's data sheets and product data for selected equipment.

/1/

3-2.1.3 Interior Distribution Systems. \1\ Describe the electrical systems including the following: lighting systems; power systems; alternate energy systems, emergency lighting; emergency/standby power; grounding systems; telecommunications system; other systems such as television; physical and electronic security features such as ESS, /1/ access control, or TEMPEST. Refer to NSTISSI 7000, TEMPEST Countermeasures for Facilities, for TEMPEST criteria.

- a. Electrical Characteristics Describe the electrical system to be provided and justify its selection. Indicate \1\ ANSI voltage designation, /1/ phase, and number of conductors.
- Switchgear and Switchboards Provide specific design information for the following:
 - Nominal system voltage.
 - Short circuit ratings.
 - Maximum voltage ratings.
 - Basic impulse level (BIL).
 - Main bus ampacity.
 - Single-line, plan, and elevation drawings with full details of instrumentation and relaying.
- c. Estimated Electrical Loads Provide a breakdown, by category, of the estimated loads (kVA). Include lighting, convenience outlet, mechanical equipment, special operating equipment, user equipment, and miscellaneous load categories.
- d. Wiring Methods Indicate the type of wiring method, such as rigid conduit, electrical metallic tubing, cable tray, nonmetallic sheathed cable, and where proposed to use.
- e. Conductors Indicate the type of conductors and insulation material such as CU, AL, THW, XHHW, and where proposed to use.
- f. Standards of Design Describe the proposed standards of design, such as voltage drop, illuminance values, type of light sources, and \1\/1/ energy conserving features.
- g. Special Systems Describe the proposed type of systems. Indicate each system's function and the interrelationships between systems, when applicable. Identify government-furnished equipment, if any. Special systems include such systems as CATV, Closed Circuit Television (CCTV), Intercom, Sound, Nurse Call, Security, or Uninterruptible Power Supplies (UPS). Identify special security requirements. Identify special physical security requirements.
- h. Telecommunications Systems \1\ Identify space required for telecommunication equipment, and size of incoming duct/conduit. Include documentation concerning telecommunications room sizes, to accommodate

interface equipment provisions for multi-use systems (i.e. special use systems, such as voice, video, and data)./1/

- i. Materials Provide manufacturer's data sheets and product data for \1\
 selected equipment./1/
- **3-2.1.4 System Maintainability**. Design the system in a \1\ manner that facilitates periodic maintenance of the equipment.

/1/

3-2.1.5 Instrumentation and Controls. Coordinate all interfaces with instrumentation and control systems provided by other disciplines, and provide required connections, either empty conduits or power wiring as required. Normally, the designer for the discipline that is responsible for the process (such as electrical, mechanical, or civil) is also responsible for the instrumentation and controls design of that system.

3-2.2 ELECTRICAL CALCULATIONS – OVERVIEW.

The Designer of Record \2\ (DOR) /2\1\ shall /1/ provide calculations (in accordance with the associated follow-on paragraphs) to verify proper design and operation of the facility to the point of connection to the existing electrical systems. \2\ The DOR is also responsible for contacting and obtaining all utility data required to complete the relay coordination study from the respective Base Electric Utility Department or Private Utility Company including existing upstream protective device types and settings. /2/

Calculations \1\ shall /1/ be described fully, written clearly, and lead the reviewer through the design by stating all assumptions and design inputs. Computer printouts are acceptable only if accompanied by explanations to allow adequate independent review of calculation methods and results.

Most electrical-related calculations for significant projects will be completed with software tools; hand calculations are typically only acceptable for minor modifications to an existing system. For power systems analyses, coordinate with the base to determine if specific software tools are required for the analyses. Whenever software tools are used to perform analyses, provide the electronic software files with each submittal. Before using any software tools, identify any base- or service-specific limitations regarding which software packages can be used. \2\

Note: The Navy Network is only able to utilize SKM software modules and EasyPower for electrical analysis. If project calculations are done using any other software, they must also be provided in either SKM or EasyPower so that they are usable by Navy personnel on the Navy Network.

Note: For the Air Force, only EasyPower is certified in accordance with AFI 33-210 for use on standard desktop systems connected to the Air Force Global Information Grid and placed on the Air Force Evaluated/Approved Products List. /2/

Calculations \1\ shall /1/ provide complete analysis with supporting data. Analysis \1\ shall /1/ cover system arrangement; voltage selection; and major equipment selections including load analysis and equipment sizing calculations. Whenever sizing electrical equipment, such as transformers, breakers, or electric cables, provide calculations to demonstrate proper facility design. The following calculations shall be provided unless the Basis of Design clearly explains why a particular calculation type is not applicable:

- a. Load analysis.
- b. Short circuit analysis, including protective device interrupting rating.
- c. Protective device time-current coordination study.
- d. Arc flash analysis.
- e. Voltage drop.
- f. Motor starting/flicker analysis.
- g. Lighting.
- h. \1\ Underground structure design. /1/
- i. Cable pulling tension.
- j. Directional Boring
- k. Sag, tension, and guying analysis.
- I. Cathodic protection calculation.
- m. Lightning protection analysis.
- n. CATV network loss calculations.
- o. ESS calculations.

\1\ Detailed requirements for each calculation item in the list are contained in the following paragraphs. /1/

3-2.3 LOAD ANALYSIS.

3-2.3.1 Preliminary Basis of Design.

- a. Load Analysis for Service Entrance Equipment, Including Feeders:
 - Complete a preliminary load analysis (Basis of Design). Base calculations on \1\ NFPA 70 /1/ criteria and use information provided in Appendix C, as applicable.

- b. Load Analysis for Service Entrance Transformer:
 - Apply the demand and diversity factors from Appendix D to the preliminary load analysis to determine the transformer size.
 - For building designs, the service transformer shall not exceed 12 VA/square foot (130 VA/square meter) of facility gross floor area or 70% of the total connected load on installations served by transformer rated 300 kVA or greater. Any design calculations exceeding these requirements shall be specifically approved by the technical reviewing authority.

Note: The above check is intended to serve as a simple confirmation that the facility transformer is not oversized.

\1\

- c. Load Analysis for Emergency/Standby Generator:
 - Provide sizing calculations including starting KVAs.
- d. Load Analysis for Alternate Energy Systems:
 - Provide maximum power calculations applicable to the type of alternate energy system.
- e. Load Analysis for Uninterruptible Power Supply (UPS):
 - Provide sizing calculations in accordance with UFC 3-520-01, section entitled "Stationary Batteries and Battery Chargers".

/1/

3-2.3.2 Follow-On Submittals.

- a. Load Analysis for Service Entrance Equipment, Including Feeders:
 - Complete a load analysis (Basis of Design). Base calculations on NFPA criteria.
- b. Load Analysis for Service Entrance Transformer:
 - Apply the demand and diversity factors from Appendix D to the final load analysis to determine the transformer size.

 For building designs, the service transformer shall not exceed 12 VA/square foot (130 VA/square meter) of facility gross floor area or 70% of the total connected load on installations served by transformer rated 300 kVA or greater. Any design calculations exceeding these requirements \1\ shall /1/ be specifically approved by the technical reviewing authority.

\1\

- c. Load Analysis for Emergency/Standby Generator:
 - Provide sizing calculations including starting KVAs.
- d. Load Analysis for Alternate Energy Systems:
 - Provide maximum power calculations applicable to the type of alternate energy system. Identify actual power delivered from source..
- e. Load Analysis for Uninterruptible Power Supply (UPS):
 - Provide sizing calculations in accordance with UFC 3-520-01, section entitled "Stationary Batteries and Battery Chargers".

/1/

3-2.3.3 Load Analysis Criteria.

Use the following additional criteria for the load analysis:

• Assign \1\ a "0%" /1/ demand factor for \1\ /1/ fire pump loads \1\ in demand calculations /1/.

\1\/1/

- Size the service conductors (continuous current rating) in accordance with Annex B (Neher-McGrath method) of NFPA 70. Minimum design ampacity rating shall be larger than the ampacity rating of the main overcurrent protective device.
- Design the incoming service, \1\ including spare conduit /1/ to fully unload the maximum rating of the service equipment (i.e. 1200 amperes for 1200 ampere rated equipment protected with 1000 ampere device).
- Design main service equipment to provide a minimum of approximately 15% combination of spare devices/space to accommodate future work.
- Select appropriate size transformers based on the standard available three phase ratings (45, 75, 112.5, 150, 300, 500, 750, 1000, 1500, 2000, and 2500 kVA) and the calculated demand load of the facility.

For small systems \1\ 225 amps or less, /1/ or for small modifications to large systems, the load analysis can be performed manually using the above criteria. For larger systems, a \1\ load /1/ analysis using computer software tools is necessary to evaluate properly all of the possible facility modes of operation.

3-2.4 SHORT CIRCUIT ANALYSIS.

Complete a short circuit analysis in accordance with IEEE Std 551 and include the following in the analysis:

- a. Include the utility system data as well as data for the distribution system. Contact the Contracting Officer \1\ or technical reviewing authority /1/ for the utility system data and available fault current on the primary side of medium voltage equipment. When accurate data does not exist, the Designer of Record \1\ shall /1/ assume that maximum available fault exists, up to a possible infinite bus on the primary side of the upstream transformer, and design the system assuming such conditions.
- b. Calculate the available short circuit and ground fault currents at each bus. Incorporate any motor contribution in determining the momentary and interrupting ratings of the protective devices.
- c. The study \1\ shall /1/ be calculated by means of a commercially-available software program designed for the type of required analysis. Incorporate pertinent data and the rationale employed in developing the calculations in the introductory remarks of the study. Equipment interrupting capability evaluations \1\ shall /1/ meet the requirements of IEEE C37.06, IEEE C37.13.1, or UL 489 criteria, as applicable.
- d. Where diagrams will not fit on standard letter size paper, present the data determined by the short circuit study in a tabular format. Include the following:
 - Device identification
 - Operating voltage
 - Protective device
 - Device rating
 - Calculated short circuit current

3-2.5 PROTECTIVE DEVICE TIME-CURRENT COORDINATION STUDY.

Design the electrical system such that any fault in the system will be preferentially isolated by the selective operation of only the overcurrent protective device closest to the faulted condition. Perform a coordination study at the design stage to establish the basis for the system design and to enable completion of an initial arc flash analysis.

Provide a final coordination study based on the as-built configuration of the system. Identify locations where selective coordination is not achievable, such as with instantaneous trips on molded case circuit breakers.

The Designer of Record is responsible for the selective coordination of overcurrent protective devices, including protective relays and medium voltage protective devices, high side transformer protection for distribution transformers, main secondary breakers, and secondary feeder protective devices. The Designer of Record \1\ shall /1/ ensure \1\ coordination /1/ between the new equipment design and the existing distribution system.

The Designer of Record \1\ shall /1/ ensure that construction contract documents require the Contractor to submit manufacturer's published time-current curves for primary fuses, relays, main secondary breakers, and secondary feeder protective devices. This information is required during the submittal process. Using the time-current curve data, the Designer of Record shall perform a coordination study in accordance with the following paragraphs to ensure that protective devices are properly coordinated.

3-2.5.1 Coordination Study. The completed study \1\ shall /1\ include a system one-line diagram, short circuit and ground fault analysis, and protective coordination plots.

The Designer of Record \1\ shall /1/ provide to the Contractor settings for relays, main secondary breakers, secondary feeder protective devices, and any other protective devices in the circuit. The final coordination study and the specified setting information \1\ shall /1/ be based on the as-built configuration.

- **3-2.5.2 One-Line Diagram(s)**. Show on the one-line diagram all electrical equipment and wiring to be protected by the overcurrent devices including breakers and fuses. Multiple one-line diagrams may be used if required to clearly present all of the required data. Also, show on the one-line diagram the following specific information:
 - a. Calculated short circuit values and X/R ratios at the project utility point of connection.
 - b. Breaker and fuse ratings.
 - c. Transformer kVA and voltage ratings, percent impedance, and wiring connections.
 - d. Identification and voltage at each bus.
 - e. Conduit material; and feeder conductor sizes, type, insulation, length and configuration.
- **3-2.5.3 Coordination Curves**. Prepare the coordination curves to determine the required settings of protective devices to assure selective coordination. Graphically illustrate on a log-log scale that adequate time separation exists between series

devices, including the utility company upstream devices where applicable. Plot the specific time-current characteristics of each protective device in such a manner that all applicable upstream devices will be clearly shown on one sheet. Include the following information on the coordination curves:

- a. Device identification.
- b. Voltage and current ratios for curves.
- c. 3-phase and 1-phase ANSI damage points for transformers directly fed from the switchgear.
- d. Minimum melt and total clearing curves for fuses.
- e. Cable damage curves.
- f. Transformer inrush points.
- g. Maximum short circuit current.
- **3-2.5.4 Settings**. Develop a table to summarize the settings selected for each protective device. \1\ Low voltage protective devices less than 225 amperes, unless adjustable trip, are not required to be included. \(/1/\) The table shall address all relays and relay functions. Include in the table the following:
 - a. Device identification and breaker or load controlled.
 - b. Relay CT ratios and electronic set point equivalents for relay tap, time dial, and instantaneous pickup points.
 - c. Circuit breaker sensor rating.
 - d. Fuse rating and type.
 - e. Ground fault pickup and time delay.
 - f. Differential relay settings.

3-2.5.5 Coordination Study Report. Include the following in each coordination study report:

- a. A narrative describing the analyses performed, the methods used, and the desired method of coordinated protection of the power system.
- b. Descriptive and technical data for existing devices and new protective devices. Include the manufacturers' published data, nameplate data, and definition of the fixed or adjustable features of the existing or new protective devices.
- c. Documentation of the utility company data including system voltages, fault MVA, system X/R ratio, time-current characteristic curves, current transformer ratios, and protective device settings.

- d. Fully coordinated composite time-current characteristic curves to ensure coordinated power system protection between protective devices or equipment. Include recommended ratings and settings of all protective devices in tabulated form.
- e. Evaluation of the total feeder inrush current with respect to relay or circuit breaker overcurrent trip settings. Power restoration following an outage should not cause a feeder trip on overcurrent.

3-2.6 ARC FLASH ANALYSES.

Complete an arc flash evaluation in accordance with NFPA 70E and IEEE Std 1584 as part of the short circuit study to determine personal protective clothing (PPE) requirements. *Note: PPE criteria shall be in accordance with Chapter 4 of UFC 3-560-01.* \1\ Direct current (DC) systems analysis is not required since it is not currently addressed in industry standards. /1/ Include the following:

- Description of the software used to perform the evaluation, including an explanation of software-specific user adjustable analysis settings that were used for the study.
- Scope of analysis. When switchgear, switchboards, and panelboards are equipped with main circuit breakers, provide both "Line Side" and "Bus Side" results for each item. If the facility or system has different operational configurations, such as different transformer supplies, emergency generator operation, or UPS bypass, evaluate each possible operating configuration and provide the arc flash results for each case. \1\ When equipment design includes dual protective device settings for the purpose of equipment maintenance (non-coordinated system), provide the arc flash result for that scenario. /1/ Summarize all data and include the worst-case results in terms of arc flash levels.
- Assumed working distance in feet. For low voltage systems, assume a
 working distance of 18 in. For medium voltage systems, assume a minimum
 working distance of 4 ft. For high voltage systems, assume a minimum
 working distance of 6 ft.
- Calculated energy in cal/cm² at each evaluated location. The design goal shall be to establish arc flash levels that result in PPE levels of Category 2 or less. Consider remote racking device designs (robots) to rack breakers in and out to limit personnel exposure to an arc flash event. Specifically identify locations where Category 2 cannot be achieved, such as upstream of a main breaker (between the breaker and an upstream transformer) or downstream of UPS systems.

- Specified protective device settings to achieve the arc flash results.
 Reconcile arc flash protective device setting recommendations with the protective device time-current coordination study.
- List of prohibited energized work locations based on arc flash results.

3-2.7 VOLTAGE DROP.

Size service and feeder conductors for a maximum voltage drop of 2 percent at the circuit's rated capacity. Size branch circuits for a maximum voltage drop of 3 percent at the circuit's rated capacity.

If the conductor size must be increased due to voltage drop, do not increase the size of the overcurrent protection device for the circuit. The overcurrent protection device may be protecting downstream equipment and increasing the size of the overcurrent setting can reduce the level of equipment protection. If the phase conductor size is increased for voltage drop, increase the size of the equipment grounding conductor proportional to the circular mil increase of the phase conductor.

3-2.8 MOTOR STARTING/FLICKER ANALYSIS.

Motor calculations \1\ shall /1/ account for both starting and running current.

Provide a motor starting/flicker analysis for motors 40 hp and greater \1\ for 480-volt systems; for 25 hp for system rated for 240 volts and below; /1/ and for distribution in housing areas utilizing electrical HVAC systems. Verify that the voltage drop at the service entrance does not exceed 5 percent during motor starting.

Refer to IEEE Std 241 for information regarding the calculation and effect of flicker.

3-2.9 LIGHTING.

Provide calculations for interior and exterior lighting systems in accordance with UFC 3-530-01.

3-2.10 \1\ UNDERGROUND STRUCTURES DESIGN. /1/

\1\ Provide sizing and cable bending radius calculations for underground structures (manholes and handholes) with cable sizing exceeding 500 kcmil. Verify design requirements of UFC 3-550-01 are met. /1/

3-2.11 CABLE PULLING TENSION CALCULATIONS.

Provide cable pulling tension calculations for \1\1/1/ medium voltage cable.

3-2.12 CALCULATIONS FOR DIRECTIONAL BORING.

Provide calculations in accordance with UFC 3-550-01, Appendix B.

3-2.13 SAG, TENSION, AND GUYING ANALYSIS.

\2\ Provide calculations in accordance with UFC 3-550-01. /2/

3-2.14 CATHODIC PROTECTION CALCULATIONS.

Provide calculations for all designs. Include environmental resistivities and justify all assumptions.

3-2.15 LIGHTNING PROTECTION CALCULATIONS.

Provide a lightning risk assessment in accordance with NFPA 780 Annex L and document the required level of protection.

\2\ If lightning protection is a design requirement, provide a lightning protection system in accordance with UFC 3-575-01. Provide side flash calculations as required by NFPA 780. /2/

3-2.16 CATV NETWORK LOSS CALCULATIONS.

Provide in accordance with BICSI.

3-2.17 ESS CALCULATIONS.

Provide calculations in accordance with UFC 4-021-02NF.

3-3 DRAWING REQUIREMENTS.

Provide adequate plans, including demolition, existing conditions, and new work, legends, details, and diagrams to clearly define the work to be accomplished. Coordinate construction drawings and specifications; show information only once to avoid conflicts.

For the Navy, comply with UFC 1-300-09N.

Utilize electrical design "Best Practices Information" located at http://www.wbdg.org/ccb/browse_cat.php?o=29&c=248 to facilitate drawing requirements and related equipment detail required by the remaining paragraphs of this UFC.

Provide a General Note at the beginning of the Electrical Drawings clarifying the work to be accomplished. The following note is recommended for most jobs:

"ALL ELECTRICAL WORK AND MATERIAL IS NEW AND SHALL BE PROVIDED BY THE CONTRACTOR UNLESS INDICATED OTHERWISE".

a. Arrangement. Arrange the Electrical Drawings in accordance with the National CAD standards at http://www.buildingsmartalliance.org/ncs/.

Drawings \1\ shall /1/ be clear and consistent in presentation and format.

Follow the NFPA 70 Metric Designations (mm) and Trade Sizes (in) for conduit.

b. Multiple Conduit/Cable Runs

To avoid misinterpretation as to the quantity of cables and conduit required in multiple conduit and cable runs, use one of the following acceptable descriptions:

- Acceptable: Two 4-inch conduits, each containing four 500 kcmil and one #2 Gnd
- Acceptable: Two 4-inch conduits, each with four 500 kcmil and one #2 Gnd
- Acceptable: Two 4-inch conduits, with four 500 kcmil and one #2 Gnd in each conduit
- Unacceptable: Two sets of four 500 kcmil and one #2 Gnd in 4-inch conduit
- Unacceptable: Parallel Service: Four 500 kcmil and one #2 Gnd in 4-inch conduit

3-3.1 LEGENDS AND ABBREVIATIONS.

All symbols used in the drawings \1\ shall /1/ be defined in the legend. Locate legend on the first electrical sheet using multiple legends where required and identifying the specific use of each legend. Use different legends for new and existing work. Avoid using composite legends that include all symbols but fail to indicate which symbols are to be used on which drawings.

Refer to electrical technical paper \2\ TP-12 /2/ "Appendices" located at http://www.wbdg.org/ccb/browse_cat.php?o=29&c=248 for typical illustrations of how to properly display legends on the contract drawings.

3-3.2 SITE PLANS.

Show utility point of connectivity to the base power and telecommunications systems on the site plan. Provide explicit direction on method of entering existing manholes. Provide all details including composition of duct banks and depth and configurations of the duct banks.

Electrical Site Plans \1\ shall /1/ be separate and distinct from other utility site plans and \1\ shall /1/ be included with the electrical drawings. Electrical and civil site plans may be combined only when the project requires minor utility work. Coordinate with the electrical engineering reviewer before combining the electrical and civil site plans.

The orientation of electrical drawings \1\ shall /1/ be consistent with the civil drawings. In addition, the orientation of partial building or site plans \1\ shall /1/ be identical to the orientation of the larger plan from which the partial was taken. Indicate the exact title of each particular detail, partial plan or elevation as identified on the cross-referenced sheet.

For overhead distribution use a separate symbol for each individual circuit; define each circuit by voltage level as well as number, size and type of conductors. Coordinate guying and conductor sag information shown on the drawings with that shown in the specifications.

3-3.2.1 Pole Details.

Indicate overhead distribution pole details on the drawings.

NAVFAC pole details are available in Adobe PDF format and in AutoCAD format at http://www.wbdg.org/ccb/NAVGRAPH/graphtoc.pdf.

Provide details in situations where an applicable pole detail has not been developed. Designer developed details \1\ shall /1/ contain the same level of detail equivalent to the NAVFAC pole details and include material requirements.

Review the information contained on Details OH-1.1 through OH-1.5a for examples of how to show overhead distribution work. Do not describe proposed work by referencing sketch numbers instead of pole detail designation symbols. Do not use pole detail designation symbols to describe existing facilities to be removed. To maintain the integrity of the pole details, do not modify pole details; include any required exceptions or modifications as supplemental information with the pole detail designation symbols. When using pole details, place a note referencing the pole detail designation symbols (similar to the following) on the drawings:

"XFB, 15FR3-N are pole detail designation symbols. Refer to Sketches OH-1.1 through OH-41 on Sheets _____ for an explanation of the use and description of equipment provided by these symbols."

Indicate conductor initial sag values. Provide initial sag values at ambient temperatures in 10 degree C (18 degree F) increments for a temperature range, which includes the outside summer and winter design temperature values. Clearly indicate each different calculated ruling span on the plans and provide initial sag for one span in the calculated ruling span.

Provide appropriate symbol and detail indicating the use of backup current limiting fuses with the device being protected. Indicate the fuse type and ampere rating as well as the voltage rating and current designation of the backup current limiting fuse.

3-3.2.2 Transformer Details.

Indicate transformer details on the drawings.

Transformer details are available in AutoCAD format at http://www.wbdg.org/ccb/browse cat.php?o=78&c=232.

These details are also provided in a PDF format within the electrical technical paper \2\ TP-12 /2/ "Appendices" located at http://www.wbdg.org/ccb/browse_cat.php?o=29&c=248.

Provide the following transformer descriptive information:

- Transformer type (e.g., pad-mounted, pole mounted, station type, unit-sub)
- KVA, single or three phase
- Voltage ratings per IEEE C57.12.00 (e.g., 11.5KV 208Y/120 volts)
- Primary and secondary connection (when using single-phase units for threephase service; specifically indicate how the units are to be connected, i.e., connect delta-wye grounded for 208Y/120 volt secondary service)

Include the following information for surge arresters and fused cutouts:

- Surge arrester kV rating
- Cutout kV, continuous ampere, and interrupting ampere rating
- Fuse link type and ampere rating.

3-3.2.3 Underground Distribution.

Profiles may be required for ductbank runs. Discuss profile requirements with the electrical reviewer. Indicate structure (manhole and handhole) tops, ductbank elevations, slopes and diameters. Coordinate structure numbers with plan sheets. Show and label all crossing utility lines, both existing and new. If depths of existing

utilities are unknown, indicate the horizontal location of the utility and indicate the vertical location with a line representing the anticipated range of elevations where the utility will be found in the field. Indicate the method of new utility installation routing above or below conflicts.

Provide a cable/ductbank schedule indicating cable identification, description, conduit size, and remarks.

Provide manhole foldout details or exploded views for all multiple-circuit primary systems and all primary systems requiring splices. Indicate the entrance of all conduits and the routing of all conductors in the manholes.

Manhole details are available in Adobe PDF format at http://www.wbdg.org/ccb/NAVGRAPH/graphtoc.pdf and in AutoCAD format at http://www.wbdg.org/ccb/browse_cat.php?o=78&c=232.

3-3.3 DEMOLITION PLANS.

Provide "Demolition" plans separate and distinct from "New Work" plans, except where only minor demolition work is required. Clearly show what is to be demolished, at an appropriate scale. Indicate the beginning and ending points of circuit removals.

For modification of or additions to existing equipment, provide the manufacturer's name and other pertinent manufacturer's identification (e.g., serial number, model number, style, and any other manufacturer's identifying markings).

Provide a sequence of demolition; if necessary, include any known requirement for continuous operation and limited shutdown requirements. Identify these in the special scheduling paragraphs of the specifications.

Indicate the quantity of lighting ballasts that contain PCBs and the quantity of lamps that contain mercury.

3-3.4 LIGHTING PLANS AND DETAILS.

Do not show lighting and power on the same floor plan, unless the scale of the plan is 1:50 ($\frac{1}{4}$ in = 1 ft - 0 in) or larger.

Provide luminaires (lighting fixtures) details and a separate luminaires schedule. Use the details and the luminaires schedule that is available in Adobe PDF format and in AutoCAD format at http://www.wbdg.org/ccb/NAVGRAPH/graphtoc.pdf. In order to maintain the integrity of the details, do not modify details; make any required exceptions or modifications in the remarks column of the luminaires schedule and not on the details themselves. Provide applicable luminaires type symbol(s) with each luminaire sketch/detail. When using luminaire(s) not included in the database, detail the luminaire(s) on the drawings providing the following minimum information:

- Luminaire type (e.g., high bay, fluorescent, industrial, downlight, roadway type, floodlight).
- Physical construction including housing material and fabrication method, description of lens, reflector, refractor.
- Electrical data including number of lamps, lamp type, ballast data, operating voltage.
- Mounting (surface, suspended, flush) and mounting height.
- Special characteristics such as wet label, specific hazardous classification, or air handling.

3-3.5 POWER PLANS.

Show all power requirements and points of connections. Specifically identify each piece of equipment including HVAC and mechanical equipment (e.g., unit heater No. 1, unit heater No. 2).

Typical illustrations showing proper methods for displaying equipment on the contract drawings are provided in a PDF format within the electrical technical paper \2\ TP-12 /2/ "Appendices" located at http://www.wbdg.org/ccb/browse_cat.php?o=29&c=248.

3-3.6 COMMUNICATIONS PLANS.

Show locations of voice and data outlets in each room, closets, and equipment spaces. Detail all outlet, cable tray and backboard or distribution frames.

Note: Power and communication systems may be shown on the same floor plans provided the design is small, the electrical designer and the telecommunications \1\ registered communications distribution designer (RCDD) /1/ are the same person, and combining the drawings is approved by the Contracting Officer \1\ or technical reviewing authority /1/. However, when there is extensive communication work to be shown, show power and communication systems on separate plans. \1\ The communications plans shall be signed by both a registered professional engineer and an RCDD. /1/

3-3.7 GROUNDING PLAN.

Provide grounding plans and details at an appropriate scale.

3-3.8 ROOF PLAN.

When roof mounted equipment, including HVAC equipment, cannot be adequately shown on the Power Plan, provide an appropriately scaled roof plan.

3-3.9 LIGHTNING PROTECTION PLAN.

Provide lightning protection plan and details at an appropriate scale. Plan \1\ shall /1/ indicate locations and number of system components required. Show air terminal installation details, roof and wall penetration details, and details to show concealed components of the system.

Coordinate roof and wall penetrations with other disciplines to ensure that the integrity of the facility envelope is not compromised.

3-3.10 HAZARDOUS LOCATION PLAN.

Provide on the drawings the boundaries and classifications of all hazardous locations in accordance with NFPA 70.

3-3.11 POWER ONE-LINE/RISER DIAGRAMS.

Provide a power one-line (single-line) diagram for:

- Medium-voltage distribution systems, including substations and switching stations.
- Systems involving generation, either low voltage or medium voltage.
- Building switchgear, switchboards, and main distribution panels (MDPs).

The one-line diagram must show all components (including metering and protective relaying), and \1\ shall /1/ indicate sizes of bus, feeders and conduits. Connections of transformers, PTs, CTs, and capacitors \1\ shall /1/ be shown on the one-line diagram by means of the proper symbol. Show potential and current transformer ratios. Indicate relay quantity and function (overcurrent, voltage, differential) using ANSI designation numbers.

On most facility-related projects, it is acceptable to combine the one-line diagram with a riser diagram. The one-line diagram would begin with the medium voltage system and continue through the transformer up to and including the main breaker and feeder breakers within the MDP. Sub-panels beyond the MDP may be shown in the riser diagram format.

Indicate kV ratings for surge arresters, and kV and ampere rating for cutouts. Indicate fuse link type and ampere rating. For capacitors indicate kVAR per unit, number of units per bank, voltage (voltage rating of units, not the system voltage), phase (e.g., three-phase or single-phase units), fuse size, and fuse type.

Show the following on the one-line diagram when a transformer is indicated.

- Primary switches.
- Wye or delta connection.
- Loadbreak elbows.
- Lightning arresters.
- kVA rating.
- Rated voltage (primary & secondary).
- Transformer identification number.
- Industry standard impedance.
- Meter type.
- CT and PT sizes.
- Fuse sizes.

Show all pertinent information on the transformer and the service entrance on the one-line diagram as opposed to the specifications. Items that are common to all transformers can be indicated by notes on the one-line diagram if a typical detail drawing is provided.

\1\/1/

Show the following on the one-line diagram when pad-mounted switchgear is indicated:

- Spare ways (cubicles).
- Protective devices.
- Loadbreak elbows.
- Switch identification number.

Show the following on the one-line diagram when a new primary is indicated:

- In-line splices in manholes.
- Normally open points.
- Number and sizes of phase, neutral and ground cables.
- Conduit sizes.

If there is demolition involved or work is to be done to existing equipment, the Designer of Record \1\ shall /1/ provide an existing one-line diagram showing the current arrangement of the gear and then show a new one-line diagram indicating by line weights what is existing or new.

Insure that information shown on the one-line diagram is not duplicated elsewhere in the construction package, as this will likely cause conflicts if changes are necessary. Indicate on the electrical legend the exact nomenclature used to indicate conductor and conduit sizing. Provide a schedule for feeder runs. Medium voltage one-line diagrams for stations and distribution systems \1\ shall /1/ have a geographic affiliation to the actual constructed distribution system.

Typical illustrations showing proper methods for displaying one-line and power riser diagrams on the contract drawings are provided in a PDF format within the electrical technical paper \2\ TP-12 /2/ "Appendices" located at http://www.wbdg.org/ccb/browse_cat.php?o=29&c=248.

3-3.12 TELECOMMUNICATIONS RISER DIAGRAM.

Clearly indicate service entrance cable and duct, entrance protector assemblies, and connections to existing outside cable plant. Include the following:

- Cross-connects. Indicate by notation that voice and data cables terminate in separate fields. Indicate method of cross connecting – patch panel or connector block.
- Telecommunications outlets, including room numbers.
- Cable for building backbone and horizontal distribution system.
- Pathway, including conduit and cable tray for backbone and horizontal distribution system.
- Telecommunications grounding system.

3-3.13 INTERCOMMUNICATION/PAGING RISER DIAGRAM.

Show power source, master station with associated equipment, speakers, and outlets. Include room numbers, wiring/conduit between components.

3-3.14 FIRE ALARM RISER DIAGRAM.

If required, fire alarm riser diagrams will be provided by the fire protection engineer.

3-3.15 \1\ SPECIAL SYSTEMS RISER DIAGRAMS. /1/

Provide other riser diagrams similar to those developed for telecommunications or intercommunication/paging.

3-3.16 SCHEDULES AND ELEVATIONS.

Provide schedules for all panelboards. The panelboard schedule \1\ shall /1/ reflect the actual circuit breaker and bus arrangement. Include the following:

- Panelboard designation and location (i.e. room number).
- Voltage, phase, frequency, number of poles, and \1\ minimum /1/ interrupting rating.
- Main amperes indicating main breakers or lugs only.
- Surface or flush mounting.
- Circuit number, wire size, breaker trip, connected load, and identification of load associated with each branch or feeder. Note that identification of load \1\ shall /1/ be specific. For example, the directory marking \1\ shall /1/ not merely indicate "Lighting," but rather "Lighting, Room 102."
- Total connected load.
- Any special breaker requirements such as GFI or SWD.

All circuiting (identifying conduit and wiring back to specific panels but not identifying the exact routing required during construction) \1\ shall /1/ be shown on the design drawings exactly as they are to be installed.

Provide plan and elevation or isometric drawings for switchboards and switchgear, showing compartments, their intended use, and instruments and controls. Clearly show contents of all sections including whether or not breakers are individually or group mounted and indicate that switchboards and switchgear \1\ shall /1/ be mounted on 4 in (100 mm) elevated concrete pads. Coordinate design of pad with structural engineer.

Provide plan and elevation or isometric drawings for Motor Control Centers (MCCs) identifying compartments. Provide schedule listing each compartment. Schedule \1\ shall /1/ include (for each compartment) description of load, load in amperes, load in horsepower, NEMA size and type of starter, breaker size, conductor and conduit size, control devices, and other special requirements.

- Indicate, on plans or in specifications, enclosure type, bus rating, bus material, bus bracing, NEMA class and wiring type, service voltage, control voltage and source, and top or bottom feed.
- Indicate on the drawings that MCCs \1\ shall /1/ be mounted on 4 in (100 mm) elevated concrete pads. Coordinate design of pad with structural engineer.
- Provide elevation of control panels, indicating front panel devices, such as indicator lights, pushbuttons, gauges, and switches.

3-3.17 DETAILS/DIAGRAMS.

Detail all telecommunications outlets, cable tray, and backboard/distribution frames. Provide elevations of pertinent communication room walls. Indicate additional details as required.

Provide a junction box detail on the drawings showing the interface between the Systems Furniture wiring harness and the branch circuit wiring.

3-3.18 GROUNDING DIAGRAMS.

Provide \1\ grounding diagrams /1/ with explicit grounding requirements beginning with the medium-voltage system and continuing through the transformer up to and including the Service entrance equipment, step down transformers, sub-panels and telecommunications systems grounding.

\1\ The service entrance grounding electrode systems and interconnections with other system grounding electrodes must be clearly shown and identified on the grounding plan. The main bonding jumper connection must be indicated and system bonding jumper connections for separately derived systems must be clearly indicated. Automatic Transfer switches must be identified indicating 3-pole design for single-phase systems and 4-pole design for three-phase systems. /1/ Typical illustrations showing proper methods for displaying grounding diagrams on the contract drawings are provided in a PDF format within the electrical technical paper \2\ TP-12 /2/ "Appendices" located at http://www.wbdg.org/ccb/browse_cat.php?o=29&c=248.

\1\/1/

Provide cathodic protection plans and details at appropriate scales. Indicate on the drawing the location of all rectifiers, anode beds, structures protected by cathodic protection system(s) and all structures that may be affected by stray current corrosion as a result of cathodic protection of the specific structure within the affected area of cathodic protection. \1\ An NACE-certified Cathodic Protection Specialist shall /1/ prepare cathodic protection drawings.

Terms

Activity – The end user of a base or facility.

Base Communications Officer (BCO) – The person(s) responsible for the telecommunications and data infrastructure for a base or facility.

Closed Circuit Television (CCTV) – A network of cables and equipment to monitor and transmit video signals throughout a facility.

\1\/1/

Community Antenna Television System (CATV) – A network of cables, headend and electronic components that process and amplify television and frequency-modulated (FM) radio signals for distribution from one central location to outlets throughout a facility.

Contractor – Person(s) doing actual construction portion of a project.

\1\ Corrosive Area – An area identified by the Technical Reviewing Authority as requiring special equipment corrosion mitigation methods. /1/

Designer of Record – The engineer responsible for the actual preparation of the construction documents.

Distribution Device – A facility located within a dwelling unit for interconnection or cross connection of interior telecommunications wiring. Passive cross connect facilities enable the termination of cable elements and their interconnection or cross-connection by means of jumpers and patchcords.

Electric Supply Station – A station that transforms the energy level (voltage) for further bulk distribution at medium voltage levels.

Low Voltage System – An electrical system having a maximum root-mean-square (rms) voltage of less than 1,000 volts.

Medium Voltage System – An electrical system having a maximum RMS AC voltage of 1,000 volts to 34.5 kV. Some documents such as ANSI C84.1 define the medium voltage upper limit as 100 kV, but this definition is inappropriate for facility applications.

Non-Linear Loads – Loads that convert AC to DC and contain some kind of rectifier.

Service – The conductors and equipment for delivering electrical energy from the serving utility or Government-owned system to the wiring system of the premises served.

Site Electrical Utilities – Site Electrical Utilities are the primary electric power distribution to the facilities and other electrical loads, \1\/1/ exterior lighting not attached

to the building; and $1\/1$ telecommunication services ($1\$ such as $1\/1$ fiber optic, copper cable, CATV $1\/1$) required by the Facilities.

Systems Furniture – Modular prewired office furniture.

Telecommunications Room – An enclosed space for telecommunications equipment, terminations, and cross-connect wiring for horizontal cabling.

TEMPEST – TEMPEST is the unclassified name for the studies and investigation of compromising emanations (communications security).

Utilization Electric Supply Station – Equipment such as pole or pad-mounted transformers or secondary unit substations that transforms the energy level (voltage) to a utilization voltage for consumer use. /2/

APPENDIX C DESIGN DATA TABLES

Table C-1 Typical Loading For Personal Computer Systems

| Component | Measured Load |
|---------------------------------------|-------------------------|
| Pentium 550 MHz Computer with Monitor | 1.48A |
| Pentium 200 MHz Computer with Monitor | 1.45A |
| HP LaserJet 4000 printer | 0.25A idle, 5A printing |

Table C-2 Load Data For Preliminary Demand Calculations

| Facility Type | VA/m ² | VA/ft ² |
|---|-------------------|--------------------|
| BEQ | 21-64 | 2-6 |
| Commissary/Exchange | 75- 97 | 7-9 |
| Cafe/Mess Hall | 75-108 | 7-10 |
| Administration Building | 64-108 | 6-10 |
| Craft/Hobby/Golf Pro | 43-54 | 4-5 |
| \2\ Shore Intermediate Maintenance Activity (SIMA) /2/ | 64-108 | 6-10 |
| BOQ | 22-64 | 2-6 |
| Warehouse/Exchange | 43 | 4 |
| Child Care | 64 | 6 |
| Chapel | 54-75 | 5-7 |
| Applied Instruction Building | 64-108 | 6-10 |

Use the above information to aid in estimating demand for transformer sizing for preliminary calculations. As the design progresses, update demand calculations to reflect actual load of the building.

Dwelling Unit Demand Data for Electrical Calculations

Note: These Tables are provided to aid the Designer of Record in estimating the total demand for "**ALL ELECTRIC**" dwelling units (including diversity). Size all distribution systems for dwellings for "**ALL ELECTRIC**". Use the data below for sizing distribution transformers, service lateral voltage drops and flicker calculations. These tables are not to be used for sizing the service laterals or service entrance conductors.

Table C-3 Dwelling Demand KVA per A/C Size

| # of HVAC | | 2 Tons | | 2.5 | 2.5 Tons 3 | | 3 Tons 3.5 | | Tons | 4 1 | ons |
|-----------|-----------|--------|-------|-------|------------|-------|------------|-------|-------|-------|-------|
| Units | Diversity | FE | Total | FE | Total | FE | Total | FE | Total | FE | Total |
| 1 | 1.0 | 3.89 | 6.42 | 4.09 | 7.25 | 4.29 | 8.08 | 4.93 | 9.35 | 5.67 | 10.72 |
| 2 | 0.85 | 6.61 | 10.91 | 6.95 | 12.33 | 7.29 | 13.74 | 8.38 | 15.9 | 9.64 | 18.22 |
| 3 | 0.82 | 8.64 | 14.91 | 9.08 | 16.95 | 9.52 | 18.96 | 10.94 | 21.95 | 12.59 | 25.16 |
| 4 | 0.80 | 10.27 | 18.37 | 10.8 | 20.91 | 11.33 | 23.45 | 13.02 | 27.16 | 14.97 | 31.13 |
| 5 | 0.77 | 11.86 | 21.61 | 12.47 | 24.64 | 13.08 | 27.68 | 15.04 | 32.05 | 17.29 | 36.74 |
| 6 | 0.75 | 13.3 | 24.69 | 13.99 | 20.21 | 14.67 | 31.73 | 16.86 | 36.75 | 19.39 | 42.12 |
| 7 | 0.73 | 14.7 | 27.63 | 15.46 | 31.61 | 16.22 | 35.58 | 18.64 | 41.22 | 21.43 | 47.24 |
| 8 | 0.72 | 16.2 | 30.76 | 17.01 | 35.22 | 17.85 | 39.68 | 20.51 | 45.97 | 23.59 | 52.68 |

Table C-4 Typical A/C Size for Dwelling Units

| Dwelling Type | A/C (Tons) | Typical (m²) | Typical (ft ²) |
|--------------------------|------------|--------------|----------------------------|
| Mobile Home, Small House | 2.0 | 93 | 1000 |
| Townhouse, House | 2.5 | 116 | 1250 |
| Townhouse, Condominium | 3.0 | 140 | 1500 |
| Condo, House | 3.5 | 163-186 | 1750-2000 |
| House | 4.0 | 186-279 | 2000-3000 |

Table C-5 Demand for Electric Strip Heat

| KW Rating of Strip | KVA Demand |
|--------------------|---------------|
| 5 | 5.0 |
| 10 | 8.0 |
| 15 | 10.5 |
| 20 | 14.0 |

FE (Full Electric) is the demand value (with diversity pre-calculated) of the load **without** a summer (air conditioning) or winter (heat strip) HVAC mechanical load included. **"Total"** is the demand which **includes** a summer air conditioner load **(Total = FE + air conditioning load).** "Total" does not include the demand associated with resistive heat elements (which may drive the need for larger transformers). **HVAC diversity** = the diversity factor to use for winter HVAC unit demand calculations. It is incumbent of the electrical designer to address loads that are larger than those associated with the summer load. Size the transformer for the summer load unless the winter load calculation is more than 140% of the summer calculation.

Example: A new underground distribution system is being designed for a housing development of duplexes. Each dwelling unit is 1500 ft² (140 m²) with a 3-ton heat pump and 5 kW of strip heat. "Total" load for 8 dwellings (maximum 4 duplexes per transformer – See paragraph "Housing Distribution" in UFC 3-550-01) and 3 ton units = 39.68 kVA (Table C3). A check of the winter load = FE (Table C3) + # of strip units x heat strip demand (Table C5) x HVAC diversity (Table C3). Winter load = 17.85 + 8 x 5 kW x 0.72 or 46.65 kVA. Summer to Winter load ratio = 46.65/39.68 or 1.18. Size the transformer for the summer load (39.68 kVA). Thus, each 50 kVA pad-mounted transformer must feed 4 duplexes.

APPENDIX D ELECTRICAL ENGINEERING PRELIMINARY CONSIDERATIONS

Appendix D provides the preliminary design considerations information previously contained in UFC 3-501-03N, *Electrical Engineering Preliminary Considerations*, which has been superseded by UFC 3-550-01. UFC 3-501-03N contained MIL-HDBK 1004/1, *Electrical Engineering Preliminary Design Considerations*. The original section numbers used in MIL-HDBK 1004/1 have been retained here for historical reference. The only changes made to this historical document has been formatting to better match the UFC format criteria.

Section 1: Preliminary Data

- 1.1 Scope. This handbook provides the criteria necessary for the proper selection of electric power sources and distribution systems. It covers preliminary load estimating factors, electrical power sources, and distribution systems.
- 1.2 Cancellation. This handbook cancels and supersedes DM-4.1, *Electrical Engineering Preliminary Design Considerations*, of December 1979, and change dated 1 March 1983.
- 1.3 Load Data. Before specific electric power sources and distribution systems can be considered, realistic preliminary load data must be compiled. The expected electric power demand on intermediate substations, and on the main electric power supply, shall be calculated from the connected load by applying appropriate factors. Determine these factors by load analysis and by combining loads progressively. To combine the loads, start at the ends of the smallest feeders and work back to the electric power source. Because all loads must be on a common kilowatt (kW) or kilovolt-ampere (kVA) basis, it is necessary to convert motor horsepower ratings to input kilowatts or kilovolt-amperes before combining them with other loads already expressed in those terms. Preliminary electric power load estimates can be made by using the approximate value of one kilovolt-ampere of input per horsepower (hp) at full load. Preliminary estimates of lighting loads may be made by assuming watts per ft² (m²) of building area.
- 1.4 Load Analysis. To determine appropriate load estimating factors, using the tables and factors in the manual as guides analyze the characteristics of each load. Consider items such as environmental conditions of weather, geographical location, and working hours, as the situation dictates. Notice that when the load densities in w/ft² (m²) are used only in preliminary estimates, the demand and load factors will be used in the final designs.
- 1.5 Terminology. Five terms are essential to the analysis of load characteristics: demand factor, coincidence factor, diversity factor, and maximum demand. These terms are defined in paragraphs 1.5.1 through 1.5.4.
- 1.5.1 Demand Factor. The demand factor is the ratio of maximum demand of a system to the total connected load of the system or

Equation: Demand factor = Maximum demand load / Total load connected (1)

1.5.2 Coincidence Factor. The coincidence factor is the ratio of the maximum demand of a system, or part under consideration, to the sum of the individual maximum demands of the subdivisions or

Equation: Coincidence factor = Sum of individual maximum demands / Maximum system demand (2)

1.5.3 Diversity Factor. The diversity factor is the reciprocal of the coincidence factor or

Equation: Diversity factor = Sum of individual maximum demands / Maximum system demand (3)

1.5.3 Load factor. The load factor is the ratio of the average load over a designated period of time, usually 1 year, to the maximum load occurring in that period or

Equation: Load factor = Average load / Maximum load (4)

1.5.5 Maximum Demand. The maximum demand is the integrated demand for a specified time interval, i.e., 5 minutes, 15 minutes, 30 minutes, or other appropriate time intervals, rather than the instantaneous or peak demand.

Section 2: Estimation of Loads

- 2.1 Preparation of Load Data. Load data are generally computed in steps such as:
 - a) individual loads,
 - b) area loads, and
 - c) activity loads.

A particular design problem may be limited to step a), to steps a) and b), or may encompass steps a), b), and c). This section outlines each step as a separate entity, dependent only on previous steps for data. Paragraphs 2.2 through 2.4.4 describe the three loads.

2.2 Individual Loads. Individual loads are those with one incoming service supplying utilization voltage to the premises. In general, these loads would comprise single structures. Large structures could contain more than one function; for example, aircraft operations, aircraft fire and rescue stations, and photographic buildings. Under this condition, factors that have been developed and keyed to Navy category codes (refer to Table 1) would be used. In this case, the factors listed under Navy category Code 141-40, 141-20, and 141-60, respectively, would be combined to obtain the total load.

- 2.2.1. Lighting. To eliminate lighting loads, divide a facility area into its significant components by function (for example, office, storage, mechanical, and corridor). Determine the average lighting level and type of light source for each area. Consider requirements for supplementary lighting (for example, floodlighting, security lighting, and special task lighting). Preliminary load estimates may be made based on the following load allowances:
 - a) 1 W/ft² (10.76W/m²) for each 6 to 8 fc (60 to 80 dekalux) of incandescent illumination.
 - b) 1 W/ft² for each 15 to 20 fc (150 to 200 dekalux) of fluorescent illumination.
 - c) 1 W/ft² for each 12 to 18 fc (120 to 180 dekalux) of mercury vapor illumination.
 - d) 1 W/ft^2 for each 26 to 36 fc (260 to 360 dekalux) of metal halide illumination.
 - e) 1 W/ft^2 for each 33 to 54 fc (330 to 540 dekalux) of high pressure sodium illumination.
- 2.2.1.1 Small Appliance Loads. Small appliance loads shall include those served by general purpose receptacles. In general, the dividing of areas by function for estimating lighting loads will serve for estimating small appliance loads. The determination of loads requires not only the knowledge of the function of an area, but to what extent its occupants use small appliances. For example, an office area demand may average about 1 W/ft² (10.76) W/m², but could vary from a low of 0.5 W/ft² (5.38 W/m² to a high of 1.5 W/ft², (16 W/m²) depending on the specific tasks to be performed. A minimum of 0.1 W/ft² (1 W/m²) for auditoriums to a maximum of 2.5 W/ft² (27 W/m²) for machine shops is possible, although the upper limit would occur very rarely. Mechanical spaces in building storage areas and similar spaces in which outlets are provided but infrequently used are usually neglected in computing loads, except for special cases.

Table 1
Factors for Individual Facilities by Navy Category Code (See Note 1)

| Navy Code | Description | Demand Factor (%) | Load Factor (%) |
|--------------|--|-------------------------|-----------------------|
| 100 | Operational and Training Facilities: | | |
| 121 | Aircraft fueling/dispensing facility | 40-60 | 16-20 |
| 122 | Marine fuel dispensing | 40-60 | 16-20 |
| 123 10 | Filling station | 40-60 | 13-17 |
| 125 16 | Miscellaneous POL pipeline facilities | 100 | 13-17 |
| 126 | Liquid fueling and dispensing-other | 40-60 | 3-7 |
| 131 | Communications – buildings | 60-65 | 70-75 |
| 131 40 | Telephone exchange building | 55-70 | 20-25 |

| 872 20 | Guard and watch towers | 80- | 46- | |
| 890 20 | Compressed air plant | 60-65 | 20-25 | |

- Note 1: Demand factors include allowance for system loss.
- 2.2.1.2 Electric Power Loads. Electric power loads shall include all loads other than lighting loads and those served by general purpose receptacles and comprise the environmental system electric power requirements and the facility occupancy equipment electric power requirements.
- 2.2.1.3 System Loss. A system loss of approximately 6 percent, based on calculated maximum demand, should be added to the building load.
- 2.2.2 Demand and load factors. The demand and load factors for a specific facility will vary with the division of load and hours of usage. Refer to Tables 2 and 3 for values that can be applied to determine demand and load factors. Table 4 is included as a guide and an aid in illustrating the method of determining loads, which are calculated for a particular type of building, such as an academic and general instruction building (Navy Code 171-10). The values given are empirical and will vary from activity to activity, and may vary from one facility to another within an activity. Annual hours use of demand must be determined for each case in accordance with methods of operation and characteristics of the installation. Demand factors and load factors for individual facilities by the Navy category code given in Table 1 are based on a survey of existing Navy facilities and past experience. Such factors should be used for quick estimating

purposes and as a check when a more precise calculation is undertaken (refer to Table 4).

- 2.2.2.1 Guides for Demand Factors. For guides on selection of demand factors, refer to Table 5.
- 2.2.2.2 Guides for Load Factors. Guides for the selection of load factors indicate the need for special considerations (refer to Table 6). Factors in the middle of the range are for the average facility at the peacetime shore establishment and should be used unless the guides in Table 6 indicate otherwise.
- 2.2.3 Load Growth. Determine the requirements for load growth for anticipated usage and life expectancy with particular attention to the possibility of adding heavy loads in the form of air conditioning, electric heating, electric data processing and electronic communication equipment. Before determining the size of service and method of distribution to a facility, an economic analysis shall be made to determine the most feasible way of serving this future load. This analysis shall include the effect on the existing installation if future loads require reinforcing or rehabilitation of the service system.

Table 2
Demand Factors for Specific Loads (See Note 1)

| Types of Loads | Estimated Range of Demand Factor (%) | Quick Estimating Demand Factor (%) |
|--|--|--|
| Motors: General purpose, machine tool, cranes, elevators, ventilation, compressors, pumps, etc | 20–100 | 30 |
| Motors: Miscellaneous, fractional, and small appliances | 10–50 | 25 |
| Resistance ovens, heaters, and furnaces | 80–100 | 80 |
| Induction furnaces | 80–100 | 80 |
| Lighting | 65–100 | 75 |
| Arc welders | 25–50 | 30 |
| Resistance welders | 5–40 | 20 |
| Air-conditioning equipment | 60–100 | 70 |
| Refrigeration compressors | 40–100 | 60 |

Note 1: Demand factors include allowance for system loss.

| 7. | Demand factor Formula = Line 4 / Line 2 (1) | | - | - | - | 60% |
| 8. | Load factor Formula = Line 6 / (Line 4 x 8760 hours) (4) | | - | - | - | 20% |

Note 1: Calculated for a 100,000 square-foot (10,000 square meter) building. See Tables 2 and 3 for data used for lines 3 and 5 respectively. Load growth is included in connected load. Maximum demand load includes allowance for system loss. For this illustration, the coincidence factor occurring when individual demand loads are added is considered to be 1.00 and has not been shown.

2.2.4 Emergency Loads. The determination of emergency electric power requirements is based on three types of loads (refer to Section 3 for types of loads to be included in each category):

Minimum essential load, Emergency load for vital operations, and Uninterruptible (no-break) load.

When the three categories of emergency electric power requirements have been ascertained, determine where local emergency facilities are required, where loads may be grouped for centralized emergency facilities, and what loads are satisfied by the reliability of the general system. Base the aforementioned determinations on safety, reliability, and economy, in that order.

- 2.3 Area Loads. Area loads consist of groups of individual facility loads served by a subdivision of the electric distribution system. The term "area" applies to the next larger subdivision of an overall distribution system. Demand loads for an area must be known for sizing the distribution wiring and switching, and in a large installation will be required for the design of substations serving the area. Table 7 gives an example of how the coincident peak demand is calculated.
- 2.3.1 General Loads. To obtain the general load, add roadway lighting, area lighting, obstruction lighting, and other loads not included in individual facility loads.
- 2.3.2 Coincidence Factor. Determine the maximum expected demands, taking into consideration whether loads within the area peak at the same or at different times.
- 2.3.2.1 Relationships. Figure 1 indicates the relationship that exists between the load factor of individual facility loads and the coincidence of their peak demands with the peak demand of the group. This relationship was developed by a study of the loads of selected naval shore activities and by the application of factors developed to the formulas published by IEEE. For collateral reading on this subject, refer to IEEE Technical Paper 45-116 Coincidence-Factor Relationship of Electric Service Load Characteristics. Table 8 is Figure 1 in tabular form with values shown to the nearest whole dollar, except for low load factors.
- 2.3.2.2 Selection. Areas with relatively insignificant residential type loads, where the load curve indicates that most of the electric power consumed in the area is used during the 40 normal working hours of a week, have coincidence factors at the higher end of the range.
- 2.3.2.3 Electric Power Consumption. In general, areas where large amounts of electric power are consumed outside the usual 40 working hours a week have a coincidence factor at the lower end of the range (examples are hospitals, areas operated on two or

more shifts, or large barracks type activities). The upper limit of the range is for the 40 hour per week operation; the lower limit is for a 60 hour per week operation.

| 50 | 73 | 69 | 100 | 100 | 100 |

2.3.2.4 Influencing Factors. The number of individual loads in a group and their load factors influence the individual load coincidence factor. The coincidence factors in table 8 apply for groups of 100 or more individual loads. These coincidence factors can also be used for groups of as few as 30 to 50 individual loads if their load factor is 0.30 of greater. For areas of fewer individual loads, the mathematical relationship from IEEE Technical Paper 45-116 provides a basis for estimating the connected coincidence factor as shown by the following equation:

Equation:
$$E_n = E_t + (1 - E_t)1/n$$
 (5)

where:

 $\mathsf{E}_\mathsf{n} = \mathsf{The}$ individual load coincidence factor applied with a given number of consumers.

 E_t = The coincidence factor as given in Table 8 in hundredths.

n = The number of individual loads in a group.

- 2.3.2.5 Individual loads. The coincidence factors in Table 8 are based on the individual loads in a group being substantially the same size. If a single load or small group of loads in an area represent a substantial percentage of overall load, the coincidence factors as given in Table 8 will no longer apply. With an individual load, increase the coincidence factor to a value commensurate with its effect on the overall area load. This is not in addition to, but in place of, the normal coincidence factor. Determine this value by considering intergroup coincidence factors given in paragraph 2.3.2.
- 2.3.2.6 An example of facility Navy Code 211-70 is presented in Table 7. For a small group, determine the coincidence peak load, and to this apply the appropriate intergroup coincidence factor to obtain the coincidence peak load for the area.
- 2.3.2.7 Groups of Loads or Areas. Where groups of loads within an area, or areas within a facility are combined, an additional intergroup coincidence factor will exist. For loads of similar nature, the intergroup coincidence factor should be in the range 0.93 to 1.00. If loads of a varying nature (evening loads and daytime loads) are combined, the intergroup coincidence factor should be in the range of 0.70 to 1.00. The lower values will occur when magnitudes of the loads are nearly balanced, and the higher ones when the combined load is predominantly one type.

- 2.3.3 Load Growth. In addition to planned expansion, increased application of electric equipment will generate an increase in load. When sizing components, such as transformers or feeders for the area system, consider possible load growth in addition to that included in determination of individual loads.
- 2.3.4 System Losses. Add distribution system losses to estimated area demands. For a good approximation, use 6 percent of the calculated maximum demand.
- 2.3.5 Emergency Loads. Review the overall emergency requirements for the area, based on criteria for the facility or as furnished by the using agency, to determine the following:
- a) The emergency loads that may be combined in groups to take advantage of the coincidence factor.
- b) The type of distribution system needed for reliability and to economically satisfy at least the less critical emergency load requirements. This reliability can be provided only if the source of electric power is not the determining factor.
- c) Area loads that must be added to individual emergency loads; for example, security lighting and minimum roadway lighting.
- 2.3.6 Expansion. The planned development of the area, as shown on the activity general development map, shall be considered for requirements of future expansion.
- 2.4 Activity Loads. Activity Loads are loads that consist of two or more area loads served from a single electric power source and an integrated distribution system.
- 2.4.1 General Loads. Follow the approach used in paragraph 2.3 for area loads. Area loads used for determining activity coincidence demand should be the area coincident demand exclusive of allowance for load growth.
- 2.4.2 Coincidence Factor. Refer to paragraph 2.3.2 for the necessary approach. Where dissimilar areas, whether residential, administrative, or industrial, are part of an activity, make a careful analysis of the coincidence factor used.
- 2.4.3 Load Growth. As for an area, components should be sized after due consideration has been given to load growth. Apply this increase to the coincident demand of the activity.
- 2.4.4 Expansion. The planned development of the activity, as shown on its general development map, shall be considered for requirements of future expansion.
